Each node is one complete solution: a four-digit address (this is what an operator cites as its parent), the mechanism in one line, then the best score — or why there is not one yet.

rank-space training objective
running
dashed border: no result yet
innovate · parents = ROOT
open a new line of attack, not a tweak
exploit · exactly 1 parent
one atomic change on an existing solution
cross · ≥ 2 scored parents
re-implement their mechanisms from scratch
cross gives a node two parents — the search structure is a DAG, not a tree.
